ABSTRACT

Objective

This study examines the effect of feeding program using a pre and post evaluation form to determine mother's independents of performance and perception of the program.

Design

A descriptive single case study method was used.

Subjects

Six mothers with their children who have Cerebral Palsy who had feeding difficulties were assigned by a sample selection criteria for this study. All participants were inpatients.

Settings

Mother and Child care unit in Centre for the Rehabilitation of the Paralysed (C.R.P.) in Bangladesh.

Main Out come measures

Pre and posttest evaluation form were used to find out the mother's level of independence. Also a semi structure face- to- face interview was conducted after the program to determine mother's satisfaction of the program.

Results

Posttest shows there was significant difference between pre and posttest performance. After the program each mother's score in each category was higher than before.

Conclusion

Every mother's performance has improved after the program and all mothers were satisfied with the feeding program.
